
FamilyFinanceChat

From a chat box to a face

Mark Fedenia Baird Professor of Finance

University of Wisconsin–Madison

CS620 Capstone Project · Fall 2026

What it is

How it works today

- In a browser — **Open WebUI** on a cloud machine
- Roughly **eight containers**, one language model
- The student **types**. The client types back.

It works. Students use it every week.

Two ways to make it better

- 1 Make what we have **fast** and **easy to change**.
- 2 Turn the chat box into **someone you talk to**.

One: solid ground

- Get **current** with the platform, and stay current
- Grading on **the web**, not on a laptop
- **Automatic** deployment and testing

Two: the leap

Today the student *types* a question
and *reads* an answer.

We want them to say it out loud,
to a face that listens and answers back.

Why that matters

In a real meeting you get **one shot**
at the hard question, out loud,
while a family watches you.

**You cannot practise that
with a backspace key.**

The project: evaluate, then build

- A dozen **avatar platforms**, all new, none proven here
- **Fast enough?** Under about a second to answer
- **Cheap enough?** Per student, and capped
- **Allowed?** Voice and video are student records

How it bolts on

Same brain. Same grading. Switch it off and nothing breaks.

What we are after

- Students **talking** to it by the end of term
- **Evidence** on whether it makes better advisors
- A finding we publish **either way**

Come build it with us.
